

THE DRAGON APPCAFÉ

JULY 23, 2026

I induced lucidity through sleep paralysis and entered the same Storyverse continuity I had explored since June 11, 2025.

I arrived inside a fairly empty building, where a woman was already waiting to hear my plan.

Internet cafés had fascinated me because I was too young to experience them before they mostly disappeared from the United States.

Elsewhere, I had seen both cheap overnight cafés and luxurious versions with private rooms, meals, beds, and enormous game libraries.

I wanted ours to be meaningfully different: every visitor would arrive ready to create something new.

The admission fee would provide a powerful computer and an AI coding agent, so customers would not need expensive subscriptions of their own.

Each person would enter with an app concept and use the café's tools to turn that idea into a working project.

Every completed app would join a growing public library for future visitors to explore.

A simple popularity system could reveal which creations people used most or found most interesting.

Instead of paying to play one fixed collection of games, customers would expand the experience every time they visited.

Everyone would arrive as both a user and a creator.

While I explained the business, my skin unexpectedly began turning purple.

Orange wings emerged from my back, and I gradually became a humanoid dragon.

The transformation felt like a message from my subconscious: this was a dream, and my idea was not fantastical enough.

This annoyed me. I was sincerely interested in exploring the café as a business thought experiment.

I decided to take the hint without abandoning the part of the concept that mattered to me.

One important part of an internet café still had no answer: the food.

Because I was dreaming, I imagined small, colorful, chewy candies that each granted a different temporary superpower.

A visitor could choose a flavor and briefly experience flight, speed, fire, crystal armor, plant growth, or another extraordinary ability.

The café would no longer help people create only applications. It would also let ordinary people experiment with new versions of themselves.

We had become an app café and a superpower café at the same time.

Temporary powers needed a place where people could learn without endangering anyone.

Customers could test one ability at a time while a visible timer measured how long the candy would last.

I designed private reinforced training rooms filled only with padded obstacles and inanimate targets.

They would never fight one another. Fire, speed, flight, and every other power would remain inside a controlled environment.

Automatic safety systems would end the effect before the customer returned to the public café.

The fantasy could feel extraordinary because the rules made it safe.

The woman finally admitted that she was the person who had transformed me.

Other fantastical internet cafés already existed throughout this dream world, and she wanted ours to stand out from the competition.

Her marketing strategy was simple: ours would be the only internet café operated by a humanoid dragon.

I accepted her reasoning, but explained that the dragon was now only one part of what made us different.

No competitor combined AI app creation, a communal app library, temporary superpower candy, and private safety training.

When the Dragon App Café opened, every customer arrived with an idea instead of merely asking what games were already installed.

AI coding agents helped those ideas become applications, and every finished project made the public library larger.

Colorful candies let visitors borrow extraordinary powers, then private rooms gave them a safe place to practice.

The woman had been right that a dragon proprietor made us memorable.

But the café mattered because technology and fantasy both gave ordinary people permission to create.

Each person entered as a user, became a builder and a temporary hero, then left something new for everyone who came next.
